**Summary**

The core foundation of excellent psychiatric treatment starts with obtaining a coherent history, preferably as a longitudinal narrative that follows a chronological timeline, with an emphasis on parsing relevant pertinent “positives” and “negatives” from that narrative. A simple organizing principle is to have patients present their concerns from a chronological perspective, in order for the clinician to develop a clear narrative. “When was the very first time you recall having any problems involving your mental health?” provides a good starting point, followed by “When was the first time you sought any kind of treatment for those problems?” A chronologically organized narrative gives some sense not only about the backdrop and longevity of a psychiatric disorder but, moreover, clues about the degree of distress and disruption caused by symptoms, the potential duration of untreated illness, and symptom severity as reflected by the kinds of interventions that previously occurred. A clinical timeline that starts with years of psychotherapy differs from one that begins with an involuntary psychiatric hospitalization or a suicide attempt; low-grade symptoms that persist for extended periods unnoticed by others, or cause no outward functional impairment, imply a different level of severity and debilitation, and possible prognosis, from those linked with more obvious outward signs of disability. For persistent problems, one always wonders why the patient is seeking help *now* and not a week or month or two ago.

# Drug Lookup

The screenshot shows the 'Drug Lookup' page on the Stahl Online website. At the top, there is a navigation bar with 'Home', 'Drug Lookup', and 'About' links. Below this is a search bar with the text 'Search Stahl Online' and a magnifying glass icon. A checkbox labeled 'Search within full text' is checked. The main content area features a search input field with the placeholder text 'Type drug name'. Below the input field, a list of drug names is displayed, including 'Abilify (aripiprazole)', 'Abilify Discmelt (aripiprazole)', 'Abilify Maintena (aripiprazole)', 'Abilify MyCite (aripiprazole)', 'Absenor (valproate)', 'acamprosate', 'Aclonium (gabapentin)', 'Aclonium (galantamine)', 'ACT Zopiclone (zopiclone)', and 'Aquilix (moclomamide)'. An orange callout box highlights the search input field and the first few items in the list. A second orange callout box highlights a magnified view of the search results for 'Abilify', showing the drug name and its generic name 'aripiprazole' in parentheses, along with other formulations like 'Abilify Maintena (aripiprazole)' and 'Abilify MyCite (aripiprazole)'.

Drug Lookup

With the range of psychotropic drugs expanding and the usages of existing medications diversifying, we are pleased to present the world's best-selling formulary in psychopharmacology.
