Infectious tracheobronchitis. Bacterial tracheitis In a severely immunocompromised patient suffering from a rheumatoid arthritis with vasculitis. She presented with dyspnoea and cough as she was in agranulocytosis secondary to cyclophosphamide treatment. A severe stenosis of the distal trachea (orange arrows) and proximal main bronchi predominant on the left side associated with a fistulous tract (blue arrow) connecting with a paratracheal submucosal abscess was shown during bronchoscopy. This was related to Pseudomonas aeruginosa, Escherichia coli and Streptococcus infection. (A) Axial CT (mediastinal window) at the level of the distal part of the trachea showing the irregular thickening with a lucency on the left side (blue arrow) related to the fistulous tract. (B) Axial CT (lung window) at the same level. (C) 3D reconstruction of the tracheobronchial tree perfectly demonstrating the whole stenosis and the fistula. (D, E) Axial CT at the level of the mainstem bronchi showing a significant decrease of the bronchial thickening after two weeks of antibiotic treatment: (D) before and (E) after treatment.

Airway Disease and Chronic Airway Obstruction
